OBJECTIVE

Seeking a DevOps/Cloud Engineer role where my expertise in designing, developing, implementing, and maintaining software and infrastructure can be leveraged to enhance the reliability of systems and applications, ensuring the successful and timely completion of projects.

PROFESSIONAL SUMMARY

CloudOps Engineer with 9 years of Experience working in and managing enterprise grade production environments. I am highly versatile in multi cloud AWS and Azure clouds, and have an extensive amount of experience building out platforms using Terraform and administering Kubernetes clusters (primarily on OpenShift and AKS, EKS), building out pipelines using DevOps and Jenkins, managing the configuration management of servers using Ansible, and overseeing the build and deployment process for both our developer teams as well as for DevOps.

- Over 9 years of experience as a DevOps and Cloud Engineer, managing enterprise-grade production environments across Azure and AWS.
- Extensive expertise in designing, building, and automating infrastructure using Terraform, Ansible, and ARM templates to support secure, scalable, and resilient cloud ecosystems.
- Advanced proficiency in Kubernetes administration (AKS, EKS, OpenShift), including deploying containerized applications with Docker, orchestrating with Helm charts, and managing clusters in both cloud and on-premise environments.
- Proven success in architecting and implementing CI/CD pipelines with Jenkins to enable consistent, rapid, and reliable software delivery.
- Strong background in network integration and security, handling fine-grained access controls, encrypted secret management with Azure Vault, and secure networking (Application Gateway, VPN, NSG).
- Experienced in monitoring and alerting solutions using Prometheus, Grafana, Splunk as integrating synthetic monitors and incident management platforms like PagerDuty.
- Led migration projects from on-premises infrastructure to cloud platforms, including seamless transfer of legacy applications and infrastructure to Azure, and setup of AWS Fargate for container orchestration.
- Skilled in writing robust automation scripts in Python and in leveraging Ansible for environment upgrades, deployment automation, and configuration management.
- Demonstrated ability to drive process improvement, define and standardize build management strategies, and ensure project delivery aligns with organizational standards and timelines.

Technical skills:

Operating Systems	Linux, Ubuntu, Unix, Windows and Amazon Linux AMI
Programming Languages	Java, Python, JavaScript, HTML, XML and C#
Version Control Tools	GIT(GitHub, Git Lab, Bitbucket)
Web Application Servers	Apache , Tomcat and WebSphere
Automation Tools	VSTS, Jenkins and Circle CI
Build Tools	Ant, Maven, MS Build and Gradle.
Configuration Tools	Chef, Puppet , Ansible, Terraform and AWS CloudFormation
Virtualization Tools	Docker, Kubernetes, VM virtual Box and VMware.
APM Tools	Dynatrace, New Relic, CloudWatch, Splunk, Kibana, Prometheus and Grafana
Cloud Platform	Microsoft Azure, AWS
Database	Oracle, SQL Server and MySQL
Scripting	Shell, PowerShell, Bash, Python.
Tracking Tools	JIRA and ServiceNow

Methodologies	Agile - Scrum , Waterfall , SRE Principles
Monitoring, Logging & Alerting	Prometheus & Grafana, AWS CloudWatch & Azure Monitor, Splunk.

PROFESSIONAL EXPERIENCE

Sr Cloud Ops Engineer
SAGE

Apr 2025 – Present

Description:

As a Sr Cloud Ops Engineer at SAGE, I support cloud infrastructure and application delivery by designing, building, and maintaining scalable environments based on client requirements. I work across the full release lifecycle from development and testing through production, with a strong focus on production stability, deployment automation, Kubernetes operations, and secure AWS cloud practices. My role also includes CI/CD implementation, Infrastructure as Code, container orchestration, repository management, and observability improvements to help ensure reliable and efficient application delivery.

Responsibilities:

- Designed and built application infrastructure based on client requirements, delivered the project through development, testing, and production, and ensured production availability, which reduced downtime and met client SLA
- Created and optimized GitHub Actions workflows to automate CI/CD processes, cutting deployment time and lowering manual errors
- Managed Kubernetes cluster configurations, including node groups, auto-scaling, and network policies, which improved performance and strengthened security on AWS
- Automated Selenium tests with Jenkins by creating dynamic pods on Kubernetes, and set up Selenium Grid using Helm charts, which accelerated test execution and increased coverage
- Tuned performance of applications on Kubernetes clusters, resulting in faster response times and better resource utilization
- Managed repository access, settings, and security, including branch protection and collaborator permissions, which protected code integrity and streamlined collaboration
- Contributed code, reported issues, and worked with team members, helping deliver features on schedule
- Designed and built application infrastructure per client needs, delivered it through development, testing, and production, and kept production applications available, supporting reliable service delivery
- Conducted code reviews, merged pull requests, and kept documentation up to date, which maintained branch stability and reduced integration problems
- Utilized GitHub Actions to build Docker images, pushed them to Artifactory, and deployed them to Kubernetes with ArgoCD, enabling continuous delivery and faster releases
- Implemented a Filebeat daemonset to send pod logs to ELK and visualized them on a Kibana dashboard, improving log visibility and troubleshooting speed
- Developed and maintained Terraform IaC to provision and manage AWS resources, which increased infrastructure consistency and reduced manual setup
- Created and maintained Helm charts for Kubernetes, automating deployment of pods, services, and HPA using CPU and custom metrics via KEDA, which streamlined scaling and reduced manual effort.
- Managed and administered GitHub repositories, implementing best practices for version control, including access control, branch protection, pull request reviews, issue tracking, and project management. Configured and maintained GitHub webhooks and third-party integrations to streamline workflows and enhance collaboration, while conducting regular audits to ensure compliance with organizational policies and standards.

Environment: AWS, Kubernetes, Jenkins, GitHub Actions, Terraform, Helm, ArgoCD, Docker, Artifactory, ELK, Kibana, Filebeat, KEDA, GitHub, Git, Selenium, OpenShift, Linux

DevOps Engineer
Knight Frank

Feb 2022 – Mar 2025

Description:

As a DevOps Engineer at Knight Frank, a global real estate and financial services organization, I supported cloud infrastructure and application delivery across AWS, Azure, Kubernetes, and DevOps automation. I was responsible for building and maintaining CI/CD pipelines, managing cloud and container platforms, developing infrastructure as code, and enabling secure, scalable deployment practices for business-critical applications. My role also included monitoring, troubleshooting, environment management, and partnering with operational support teams to ensure reliable production releases and stable platform performance.

Responsibilities:

- Provisioned EC2 instances, ELB, S3, IAM, and configured secure VPC networks (subnets, route tables, VPC peering) in AWS, which reduced provisioning time and improved network reliability
- Established a GitLab CI/CD pipeline that automated builds and deployments, cutting release cycle time by 40%
- Generated Docker images from Dockerfiles and uploaded them to Azure Container Registry via GitLab, enabling faster container deployments
- Deployed Docker images to AKS using Helm charts and Terraform, streamlining release processes and reducing manual configuration errors .
- Developed reusable Terraform modules for enhanced versatility and efficiency.
- Created versatile pipeline scripts in GitLab that standardized builds across projects, improving pipeline consistency
- Integrated networking components across multiple accounts and on-premises using Application Gateway, VPN, and NSG, simplifying connectivity and reducing latency
- Created synthetic monitors and alerts in Splunk, synchronized them with PagerDuty and email alerts through Active Directory user groups.
- Integrated Jenkins CI/CD with GIT version control and implemented continuous build based on check-in for applications and created Gitlab Webhooks to set up triggers for commit, push, merge and pull request events to drive all builds.
- Managed Kubernetes cluster configurations, including node group setup, auto-scaling, and network policy enforcement to enhance cluster performance and security.
- Patched OpenShift nodes and updated quotas, network policies, and secrets, maintaining cluster stability as the application scaled
- Implemented ServiceNow in the project to track and address user issues.
- Deployed application versions with Ansible and Terraform, enabling consistent rollouts and reducing deployment errors
- Developed and executed an Ansible playbook to upgrade the AKS cluster, minimizing downtime during upgrades
- Administered GitHub repositories, managing access controls, branch protection rules, and organizational settings; conducted code reviews and maintained documentation and repository integrity.
- Collaborated with the Operational Support organization to manage the deployment process, ensuring deployments were automated, reversible, and minimized downtime, thereby enhancing the reliability of production systems.
- Managed and communicated environmental configurations to the wider team, streamlining the environment provisioning process for developers and supporting their work effectively.
- Developed Infrastructure as Code (IaC) with Terraform to provision and manage scalable AWS infrastructure, improving consistency and reducing manual intervention.
- Monitored capacity on development and test environments, taking proactive remedial actions to ensure sufficient resources were available for ongoing development and testing activities.
- Configured alerting rules in Prometheus and integrated them with Grafana, enabling proactive notifications through Azure Monitor and email for any critical threshold breaches.

Environment: AWS, Azure, Kubernetes, OpenShift, Jenkins, GitLab, GitHub Actions, Terraform, Ansible, Helm, Docker, ACR, AKS, Artifactory, ArgoCD, Splunk, Prometheus, Grafana, ServiceNow, PagerDuty, Application Gateway, VPN, NSG, Active Directory, Linux, Git

DevOps Engineer
Omega Healthcare Pvt.Ltd

Jul 2017 – Jan 2022

Description:

As a DevOps Engineer at Omega Healthcare, I worked on a live healthcare platform supporting secure application deployments, infrastructure automation, and cloud migration efforts in a HIPAA-regulated environment. I handled day-to-day operations across AWS, Azure, Kubernetes, and Terraform, including migrating legacy workloads to AWS, maintaining CI/CD pipelines, deploying microservices, and supporting production stability through monitoring, troubleshooting, and performance tuning. I also collaborated with development and operations teams to improve release reliability, automate repetitive tasks, and ensure infrastructure changes followed security and compliance expectations for healthcare data.

Responsibilities:

- Managed tasks across AWS, Azure, Kubernetes, and Terraform to support platform reliability
- Assisted in migration of legacy infrastructure to AWS, provisioning resources with Terraform and managing state with S3 and DynamoDB.
- Monitored and maintained Jenkins and SonarQube environments, troubleshooting issues and optimizing build performance and resource utilization.
- Created and maintained Helm charts to automate the deployment of Kubernetes resources including services, pods, and Horizontal Pod Autoscalers (HPA) using KEDA for custom and CPU-based scaling. Deployed applications to Kubernetes clusters using Helm and ArgoCD for GitOps-based continuous deployment.
- Automated, tested, and maintained AWS configurations, improving environment consistency
- Migrated on-premise infrastructure to AWS Cloud, reducing operational costs

- Collaborated with development teams to containerize applications using Docker and deploy via Kubernetes (EKS).
- Implemented Prometheus monitoring for Kubernetes clusters, enabling early detection of performance issues
- Setting up AWS Board to create and manage the Work Items like epic, feature Etc.
- Developed reusable Groovy Jenkins pipelines with shared libraries to enforce consistency across projects.
- Created Terraform scripts to automate cloud services, speeding up resource provisioning
- Tuned application performance on Kubernetes clusters to optimize resource usage and ensure responsiveness under varying loads.
- Migrated legacy applications and infrastructure from on-premise to AWS Cloud, enhancing scalability
- Configured Istio service mesh components such as gateways, virtual services, and routing rules within the istio-system namespace to manage microservice communication.
- Setting up AWS Fargate Service to deploy the docker images and manage the applications
- Implemented Code securities like SAST during build phase and DAST after deployment as part of automated pipeline
- Enhanced monitoring with Prometheus for Kubernetes clusters, allowing quicker identification of issues
- Wrote Python scripts to automate deployments, reducing manual effort
- Managed Linux platforms, ensuring stable operation of services
- Automated CI/CD pipelines for multiple microservices using Jenkins jobs, accelerating release frequency
- Deployed microservices to Kubernetes clusters via Jenkins CI/CD pipelines, improving deployment consistency

Environment: AWS, Azure, Kubernetes, Terraform, Jenkins, SonarQube, Helm, ArgoCD, Docker, EKS, Prometheus, KEDA, Istio, AWS Fargate, Python, Linux, S3, DynamoDB, Git, Groovy, SAST, DAST

EDUCATION

Master of Science in Computing and Technology, Northumbria University, London-2023.

Bachelor of Technology (Electronics and Communication Engineering), RMK University, INDIA.
